

TEACHER MAP DASHBOARD | AISA

User guide

How to get your files out of NWEA, what every number means, what each section of the dashboard tells you, and what to do about it before the next data conversation.

Built from the dashboard itself, using its own sample data, so the pictures and the section text are the same ones you see on screen. Every section on the page also carries a ? in its corner that says the same in three short answers.

Your file never leaves your computer. The dashboard reads it in your browser, loads nothing from the internet, and stores nothing about your students.

Contents

- 1** What this tool is, and what it never does

- 2** Getting your files out of NWEA MAP

- 3** Loading a file and choosing what you look at

- 4** Reading the numbers

- 5** The sections, one by one

- 6** Printing, exporting and the classroom wall

- 7** Before a data meeting

- 8** When something looks wrong

- A** Glossary and reference tables

1. What this tool is, and what it never does

The dashboard turns an NWEA MAP Growth export into a classroom planning view: who grew, who needs support, who closed a gap, how to group the class, what to say at a data meeting and what to put on the wall. It is one web page. Open it, drop your CSV on it, and everything you see is computed from that file in your own browser.

PRIVACY

Nothing is uploaded anywhere. The page loads no third-party scripts, fonts or trackers, so it also works offline and behind a school filter. The only things remembered between visits are your theme and motion preferences; no student data is ever written to disk or sent to a server. Closing the tab forgets the file.

It is built for teachers rather than analysts. Three habits run through every section:

- **It says when a number is too thin to trust.** Any share resting on fewer than 10 records is shown as a count ("3 of 4") rather than a percentage, because a percentage over a handful of students is one child rounded to a whole number.
- **It separates achievement from growth.** Where a score sits is one question; how far it moved compared with students who started in the same place is another. High achievement can hide low growth, and a low start can hide strong growth.
- **It explains itself.** Method notes sit under the figures they qualify, and the ? in the corner of every section opens a short explanation in place.

Two words it uses precisely: a **record** is one student in one subject, so a student tested in three subjects is three records; a **student** is a person. Most figures count records, and the page says which.

2. Getting your files out of NWEA MAP

You need two kinds of export for the whole picture, and they have to match. The **Achievement Status and Growth (ASG)** report carries growth: where each student started, where they are now, and NWEA's projection. The **Class Profile** report carries the instructional areas inside each subject, one file per subject. Load both and the dashboard folds each student's two records into one.

The Achievement Status and Growth (ASG) export

1. Sign in to MAP Growth and open *MAP Reports*.
2. Choose the *Achievement Status and Growth* report for your class and the two terms you want compared (for example Fall to Spring).
3. Use the export or download option and choose CSV.
4. Save the file somewhere you can find it. You do not need to open or edit it.

The Class Profile exports

1. In *MAP Reports*, choose the *Class Profile* report for the same class and the current term.
2. Run it once per subject – mathematics, reading, language usage, science – and download each as CSV. Each file is one test.
3. Keep them with the ASG file. You will upload all of them together.

GET BOTH RIGHT

Same class, same term, every student in both. The dashboard matches each student's ASG record to their Class Profile record by student ID and subject. If the two exports disagree about a student's score – the same test with two different results – the Data Check names the student, both figures and both files, and keeps the growth record. Check the exports rather than trust either number for that student.

Column names are matched automatically, so slightly different exports still work, and comma, semicolon and tab separated files are all read. Suppressed values (the asterisks NWEA prints for small groups) and missing scores are handled.

A fall upload with one test window

In September there is nothing to compare against yet. Upload the single-window export anyway: the dashboard detects it and switches to a start-of-year view with tiers, norm placement and growth targets instead of showing empty growth panels. It does not matter whether the export puts the fall test in the Start or the End columns.

Several files at once

Select all the files at once when you upload and they are read as one data set. Where an ASG file and a Class Profile file describe the same test, the two are folded into one record so growth and instructional areas sit on the same student. An ASG file on its own gives you everything except the instructional areas; Class Profile files on their own give you the areas and one window, but no growth.

NOT READY TO EXPORT?

Click *Load Sample Data* on the upload panel to explore every feature first, with a made-up grade 5 and 6 cohort of four classes, loaded the way yours would be: an ASG export and a Class Profile export together. Everything in this guide was pictured with that sample.

3. Loading a file and choosing what you look at

The upload panel. Drag files onto the dashed box or click it to browse.

Drop your CSV on the upload box, or click it and choose the file. Once a file is loaded the panel shrinks to a status line with the record and student counts; *Change file* brings it back. The banner below the panel says what kind of file it is:

A growth file: two windows, so growth, gap closure and quadrant movement are all measured.

A single-window file: the dashboard says why no growth figure appears and analyses the window it has.

- **Growth file** – most records carry both windows. Everything is available.
- **Mixed file** – a growth file where a meaningful share of records only have the current window, usually students who joined after the earlier test. Growth panels describe the records with a prior score; the others are read from the achievement and norm columns.
- **Baseline file** – one window only. Growth, gap closure and quadrant panels are hidden rather than shown empty; the Starting Point section, tiers, norm placement and targets take their place.

Filters

The filter bar stays at the top of the page as you scroll.

Every section, card, poster and export follows the filters. Search by student name or ID; narrow to a subject or a class; *More filters* adds teacher, grade, band, met growth, planning group, gap status and tier, and a switch between the subject lens and the class lens for the overview cards. When the export marks a test as not valid, a tick box lets you put those records back. *Reset* clears everything.

The quick-question chips at the top jump straight to the section that answers them, and the *Jump to* bar lists every section the file makes available.

Essentials and the full analysis. The page opens on the 9 sections a class teacher acts on each term; the rest are one click away, with *More analysis* at the end of the *Jump to* bar or *Show the full analysis* at the foot of the page. The choice is remembered, as a preference about the page and nothing about a student, and *Essentials only* puts it back. Chapter 5 marks which sections are which.

4. Reading the numbers

RIT score

NWEA's equal-interval scale, roughly 140 to 260, running through every year of school without restarting. Growth is measured in RIT points. It is the number to quote when you talk about progress.

Percentile

Where a RIT sits against students in the same grade nationally, out of 100; 50 is the middle. It is not the share of questions answered correctly.

Colour bands and tiers

Percentiles are grouped into five bands twenty points wide, and the same cut points give the instructional tiers used for planning. A band is where a student is today, not a label.

Projected and observed growth

NWEA projects, from each student's own starting RIT and grade, how much a typical peer grows between the two windows. Observed growth is what happened. *Met growth* means observed was at least the projection; *exceeded* means more.

Conditional growth percentile (CGP)

A student's growth ranked against students nationally who started at the same RIT and grade. 50 is typical growth from that start, which makes it fair to low and high starters alike. Above 50 is faster than typical.

US norms and grade-level equivalence

The mean RIT for each grade and season in NWEA's norms study, built into the page as a reference table. "vs US norm" is the distance from that mean; "testing a grade below" is an approximation from grade means, not a reading or maths grade level, and least reliable at the ends of the scale. When a file says it was scored against a different norms study, the Data Check says so and the RIT-versus-norm figures should be read with care.

The secure benchmark

The 61st percentile is a locally chosen line for "secure", not an NWEA definition. The 41st is the on-track line, the 21st the top of the intensive tier, the 81st the start of advanced. Gap closure measures movement towards or past the 61st among students who started below it.

Counts instead of percentages

Under 10 records a figure prints as a count. Widen the filters, or read the counts as counts; they carry the same fact without implying a precision the denominator cannot support.

Too close to call

Where the export carries a standard error, a met-growth result that sits within measurement error of the projection is marked "too close": the test pair cannot resolve it either way, and it is neither a miss to chase nor a win to celebrate.

BAND	PERCENTILE	TIER	LEVEL	RANGE
Red	0 to 20	Intensive	Tier 3	At or below the 20th percentile
Orange	21 to 40	Strategic	Tier 2	21st to 40th percentile

BAND	PERCENTILE
Yellow	41 to 60
Green	61 to 80
Blue	81 to 100

TIER	LEVEL	RANGE
On Track	Tier 1	41st to 60th percentile
Secure	Tier 1	61st to 80th percentile
Advanced	Extend	81st percentile and above

5. The sections, one by one

Each entry below is the text behind the section's ? button: what it shows, how to read it, and what to do with it. Each says whether it is one of the essentials the page opens on or part of the full analysis, and sections that mean something different on a single-window file say so.

Five of them are built for a closer look at the numbers: **Insights** (the headline figures and a ranked list of what stands out, each with how sure it is), **Distributions** (every record as a dot over a box plot), **Movement** (which band each record started and ended in), **Heatmap** (groups against subjects, and students against instructional areas) and **Explorer** (any two measures plotted against each other). They describe the students in the file: where two groups differ, or two measures move together, they say how strongly, never why.

5.1 Spoken Briefing

ESSENTIALS On the page as it opens.

Spoken Briefing

▶ Play briefing Stop ?

A narrated walk through what this file says, read aloud by your own device. Nothing is sent anywhere.

THE FILE

Our class

903604

studentsrecordssubjects

Right, let's look at your class. 90 students here, with 360 results between them, from Fall 2025 through to Spring 2026. That's across 4 subjects: Language, Mathematics, Reading and Science. Five minutes and you'll know where they are and what to do about it.

The fileWhere the group isGrowthBy subjectWhat to do nextBefore you act on it

←→VoiceNo voices on this deviceSpeed

No voices are installed on this device, so the briefing plays as slides without sound. Adding a system voice in your operating system's accessibility settings will enable it.

▶ Read the transcript instead

Spoken Briefing, shown with the sample data.

WHAT IT SHOWS

A short narrated walk through what the records in view say: who is in the file, how achievement and growth compare with national figures, what stands out, and what to do next. Your own device reads it aloud; nothing is sent anywhere.

HOW TO READ IT

Each scene is one idea, built from the same figures as the sections below it, so it follows your filters. The transcript under the player has every word, for reading instead of listening or for pasting into notes. The voice and speed are your device's own.

WHAT TO DO WITH IT

Play it at the start of a data meeting or a planning conversation, filtered to the class or subject the meeting is about, so everyone hears the same summary before the detail.

Your file never leaves your computer.

Page 9 of 48

5.2 Insights

ESSENTIALS On the page as it opens.

WHAT TO DO WITH IT

Open a data meeting here. Take the top two findings into the conversation, click through to the students named on the unusual-growth card, and use Compare groups by (it starts on the grouping chosen under More filters) to see whether a gap sits between subjects, classes, teachers or grades. Copy the findings into your notes when you are done.

ON A SINGLE-WINDOW FILE

The headline numbers for a single-window file, each set against a national reference, then what stands out about where students are starting: achievement against the national middle, the share in the lowest and highest bands against the one in five you would expect nationally, the widest gap between the groups you compare, and any warning about test reliability.

Nothing here measures growth: with one test window there is no earlier score to compare against. Findings are ranked by the strength of the evidence and each says how sure it is. Every test counts each student once, and a gap between groups is only called one when both have at least 10 students and it is at least 0.3 standard deviations wide.

5.3 Class Snapshot

ESSENTIALS On the page as it opens.

WHAT TO DO WITH IT

This is the one-minute summary for a data meeting. Export it as text, or filter to one class or subject and the whole page, this card included, describes that group.

ON A SINGLE-WINDOW FILE

The headline figures for a single-window file: students and records, the median percentile, the mean RIT, distance from the US norm mean, the share at or above the norm and at or above the secure line, and how many records start in Tier 2 or 3. The banner explains why no growth figure appears.

Nothing here measures movement: with one test window there is no earlier score to compare against. A share resting on fewer than 10 records prints as a count.

5.4 Achievement Profile (called Starting Point on a single-window file)

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Achievement Profile, shown with the sample data.

WHAT IT SHOWS

The instructional tier ladder for the current window (Intensive at or below the 20th percentile, Strategic 21st to 40th, On Track 41st to 60th, Secure 61st to 80th, Advanced 81st and above), placement against the US grade and season norms, and a breakdown by subject or class.

HOW TO READ IT

Tiers describe achievement only: where a student is, not how far they moved. The grade-level equivalence is an approximation from grade-mean RIT scores, not a reading or maths grade level, and it is least reliable at the top and bottom of the scale.

WHAT TO DO WITH IT

Click a tier row to filter the whole page to that tier. Use the counts to size intervention and extension groups before the timetable is fixed.

Starting Point

Export Baseline CSV

Where this group is beginning, from the Fall 2025 window. 356 of 356 visible records have a percentile.

Why there is no growth here

This file has one test window, so no growth can be measured. Everything below describes where students are starting, not how far they have moved.

What you can plan from

Percentile placement, distance from the US grade/season norm, approximate grade-level equivalence, and instructional tiers are all measurable from one window.

What to do next

Use the tier ladder to size your groups, then set targets in Growth Goals so the winter or spring upload has something to measure against.

INSTRUCTIONAL TIERS

PLACEMENT AGAINST US NORMS

Grade-level equivalence compares a student's RIT with the mean RIT for each grade in the same season. It is a rough placement signal, not a reading or maths "grade level", and it is least reliable at the top and bottom of the scale.

BY SUBJECT

Subject Overview, shown with the sample data.

WHAT IT SHOWS

One card per subject with its key figures: records, averages or medians, the shares that met growth or sit above the norm, band movement and ground gained against the norm. The lens switch turns it into one card per class instead.

Your file never leaves your computer.

Page 15 of 48

HOW TO READ IT

Compare cards, not students. Where a card shows a count instead of a percentage, it rests on fewer than 10 records and the comparison is a description of this file rather than a finding. The class lens compares groups inside one upload, which is not a national comparison.

WHAT TO DO WITH IT

Find the subject that needs attention first, or switch the lens to class and see how the groups in the file sit next to each other.

5.6 Subject Charts

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Subject Charts, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

For each subject: start and end achievement, projected against observed growth, met and exceeded rates, and the distribution across the five colour bands.

HOW TO READ IT

Bars start at zero, so lengths compare fairly. Thin data is drawn from counts, and the same rule applies: fewer than 10 records is a handful of children, not a rate.

WHAT TO DO WITH IT

Use them in a team meeting where a picture is quicker than a table, and print the page when the meeting is on paper.

5.7 Distributions

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

WHAT IT SHOWS

The shape of the scores, not just their average: one row per subject (or per class, with the lens switch), every record drawn as a dot over a box that spans the middle half of the group. Choose the measure above the chart: current percentile or RIT, and in a growth file RIT change or conditional growth percentile. A table of summary statistics sits underneath.

HOW TO READ IT

The thick line is the median and the box holds the middle half of the records, so a wide box is a spread-out group and a narrow one a tight group. The diamond on the box is the mean; the whiskers reach the furthest record within one and a half box-widths. On a percentile measure the faint stripes are the five NWEA bands; on a growth measure a purple dot met its projection and a gold dot did not. A row with fewer than 10 records is hatched: it describes a few students, not a pattern, and the 95% interval in the table shows how far its mean could move.

WHAT TO DO WITH IT

Look for the group whose median sits where you expected but whose box is twice as wide as the others: one lesson pitched at the middle will miss both ends of it. Select a dot to open that student's profile, and export the table for a department meeting.

ON A SINGLE-WINDOW FILE

The shape of this window's scores: one row per subject (or per class, with the lens switch), every record drawn as a dot over a box that spans the middle half of the group, by current percentile or RIT, with a table of summary statistics underneath. Growth measures appear once a second window exists.

The thick line is the median and the box holds the middle half of the records, so a wide box is a spread-out group and a narrow one a tight group. The diamond on the box is the mean; the whiskers reach the furthest record within one and a half box-widths. The faint stripes are the five NWEA bands. A row with fewer than 10 records is hatched: it describes a few students, not a pattern.

5.8 Growth and Achievement

ESSENTIALS On the page as it opens.

Growth files only: this section is hidden when the export carries a single test window.

Growth and Achievement, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS	NWEA's growth and achievement quadrants for the end window, the movement between quadrants since the start window, a scatter of every record, and median conditional growth by starting band.
HOW TO READ IT	Achievement is where a score sits; growth is how far it moved compared with students who started in the same place, where 50 is typical. High achievement can hide low growth, and a low start can hide strong growth. Bands with fewer than 5 records are drawn but never read.
WHAT TO DO WITH IT	Look for the two patterns that matter most: secure students who are coasting, and low starters whose catch-up growth is working and needs protecting.

5.9 Movement

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Growth files only: this section is hidden when the export carries a single test window.

HOW TO READ IT

Each cell's shade is its share of the row, so a row answers "of the students who started in this band, where did they end up?" A row resting on fewer than 10 records is hatched and prints counts, not percentages. A student who started in Blue can only stay or slip, and one who started in Red can only stay or rise, so compare rows with that in mind. A change of a few percentile points can be measurement error rather than real movement, and only records with both windows are counted: new arrivals appear in the note, not the matrix.

WHAT TO DO WITH IT

Click any cell, or one of the moved up, stayed and moved down buttons, to list the students in it, and open a name for their spotlight. Start with the records that slipped a band. Then read the row for the band most of your class started in: a strong diagonal there means those students held their place, and a heavy right-hand side means they are climbing. Export the list when you need it in a planning document.

Further down Movement: every record's percentile change as a dumbbell, from the start percentile (hollow dot) to the end percentile (filled dot).

5.10 Gap Closure

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Growth files only: this section is hidden when the export carries a single test window.

Gap Closure, shown with the sample data.

WHAT IT SHOWS

Among records that started below the 61st percentile: how many closed the gap, reduced it or widened it, and the pooled share of the total distance that was closed. Also band movement, and whether secure starters extended or slipped.

HOW TO READ IT

The 61st percentile is a locally chosen secure line, not an NWEA definition. Percentile points are positions in a distribution rather than equal units, so read gap closure as direction and rough size. Pooled closure is total points closed over total points to close, not an average of individual rates.

WHAT TO DO WITH IT

Celebrate the closers by name in class, and look first at the secure students who slipped, because core teaching alone rarely catches them.

5.11 Growth Goals

ESSENTIALS On the page as it opens.

Growth Goals

Export Goal Sheet CSVPrint Goal Sheets?

Thandiwe Dlamini	Mathematics	186	5	-	-	-	5	216	+4
Ilya Sokolov	Reading	184	5	-	-	-	6	212	+3

Growth Goals, shown with the sample data.

WHAT IT SHOWS

Norm-referenced RIT targets for the next reporting point: the typical gain a peer makes, a keep-pace target, the grade-level target and the stretch above typical some students need. Where a fall export carries NWEA's own projection, that figure leads.

HOW TO READ IT

Keep pace means holding your relative position; grade level means reaching the norm mean. Typical gain comes from the difference between two norm means, not from NWEA's projection for an individual student. The norm table built in is a reference, not the official study.

Your file never leaves your computer.

Page 23 of 48

WHAT TO DO WITH IT

Print the goal sheets, set a written target for every student who needs above-typical growth, and re-upload after the next window so the target becomes a result.

ON A SINGLE-WINDOW FILE

Norm-referenced RIT targets for the end of this school year, so the winter or spring upload has something to measure against: the typical gain, a keep-pace target, the grade-level target and the stretch above typical some students need. Where the export carries NWEA's own projection for the window ahead, that figure leads.

5.12 Action Board

Move: Read these from the achievement and norm columns instead, and set a goal now so the next window has a baseline.

Action Board, shown with the sample data.

WHAT IT SHOWS

The handful of moves with the most leverage this week, ranked, each with the students it applies to and the move to make.

HOW TO READ IT

Each card names students, deduplicated across subjects and capped at forty names; the reason on the card is the rule that put them there. A student can appear on more than one card.

WHAT TO DO WITH IT

Treat it as this week's plan. Print it or copy it into your planning notes, and come back after the next window to see which cards emptied.

5.13 What Would It Take?

What Would It Take?

How far this group is from having 60% of records at or above the 61st percentile, and which students are closest to it.

THRESHOLD

61st percentile – secure benchmark

TARGET SHARE (%)

60

The line you want students above.

Leave as set, or type the percentage your plan aims for.

AT OR ABOVE NOW

58%

208 of 360 scored records

TARGET

60%

61st percentile – secure benchmark

RECORDS STILL NEEDED

8

To reach the target share

FURTHEST OF THOSE

4 pts

Percentile points Adaeze Nwosu needs

BELOW THE LINE

152

All records under the threshold

Moving the students already closest to a line is the fastest way to change a percentage and the wrong way to decide who gets taught. Use this to size a goal and to see how far off it is; the Support List answers who needs the teaching. Percentile points are also not equal-sized units, so two records the same distance from the line are not the same amount of work.

152 records below the 61st percentile, 8 of them needed for the target

STUDENT	SUBJECT	PERCENTILE	POINTS TO LINE	BAND	CHANGE THIS WINDOW	MET GROWTH	PLANNING GROUP
Jun Wong	Language	60	1	Yellow	+10	Yes	Catch-Up Growth

Isla Campbell	Language	57	4	Yellow	-10	No	Secure but Regressing
Jia Hui Lim	Reading	57	4	Yellow	+7	Yes	Catch-Up Growth

What Would It Take?, shown with the sample data.

WHAT IT SHOWS

How far the group is from having a chosen share of records at or above a chosen percentile line, and which records are closest to that line.

HOW TO READ IT

This sizes a goal; it does not decide who gets taught. Moving the students nearest the line is the fastest way to change a percentage and the wrong way to choose who needs help. The support list answers that question.

WHAT TO DO WITH IT

Pick the line and the share you would be judged against, see how many records it would take, and set a target the class can own.

5.14 Cross-Subject Profiles

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Cross-Subject Profiles, shown with the sample data.

WHAT IT SHOWS

For every student with two or more subjects: their strongest and weakest subject, the spread between them in percentile points, and in a growth file the same comparison for conditional growth.

HOW TO READ IT

A spread of 30 points or more is an uneven profile. It usually means a different group in one subject than another, not a different child.

WHAT TO DO WITH IT

Use it when grouping: a student who is secure in reading and intensive in maths belongs in two different groups, and one grouping decision will not carry the day.

5.15 Heatmap

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

ON A SINGLE-WINDOW FILE

A grid with a row for each class, teacher or grade in view and a column for each subject, plus an All row and column, coloured by median percentile or by the share at or above the 61st percentile. With a Class Profile export, a second grid shows every student's instructional areas against their own overall RIT, class median on top.

With one test window this shows where each group starts, not how far it has moved. The stronger the purple, the higher the value, and the colour steps are fixed, so a colour means the same after a filter. A hatched cell rests on fewer than 10 records, and a share there prints as a count. A difference between two cells describes the students in them; it is not a tested finding.

STUDENT AREAS

Every student's instructional areas against their own overall RIT, highest overall score first, with the class median on top. The Areas section tests the class pattern and names the teaching groups; this grid shows where in the class a gap sits.

SUBJECT

Language Reading · Reading 2-5 Reading · Reading 6+ Mathematics · Math 2-5 Mathematics · Math 6+ Science · Science 3-5 Science · Science 6-8

INSTRUCTIONAL AREAS · 90 STUDENTS

Language: each student's areas against their own overall RIT

Gold is below the student's own level, purple above. Numbers mark the differences of at least 8 RIT, the noise floor in this file; lighter tints are inside it.

AREA RIT MINUS OWN OVERALL RIT

STUDENT	RIT	Writing: Write, Revise Texts for Purpose and Audience	Language: Understand, Edit for Grammar, Usage	Language: Understand, Edit for Mechanics
Class median	214.5	-1.0	+2.5	-1.0
Farhan Chowdhury	247

Astrid Nyberg	228			-9
Jia Hui Lim	228		+11	-11
Lukas Müller	228			
Ananya Reddy	226			

Language: Understand, Edit for Mechanics has the most students at least 8 RIT below their own level: 10 of 45 in the top half by overall RIT and 4 of 45 in the bottom half, so the gap sits mostly in the top half of the class. With groups this size read it as a lead to check, not a finding.

► [Show the numbers](#)

Further down the Heatmap: every student's instructional areas against their own overall RIT, which appears when a Class Profile export is loaded.

5.16 Instructional Areas

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Class Profile exports only: an ASG export does not carry instructional areas, so this section appears only when a Class Profile file is loaded.

Instructional Areas, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

From a Class Profile export only: the instructional areas within each subject where the class stands out as a strength or a gap, and the students whose own area score sits well below their overall score.

HOW TO READ IT

Area scores are read against each student's own overall RIT, because NWEA publishes no norm for an area, so above means above their own level, not above grade level. Class patterns need a confidence interval that clears zero; individual flags need a difference larger than the noise floor.

WHAT TO DO WITH IT

Choose what to reteach to the whole class from the class patterns, and who needs the small group from the flagged students.

5.17 Class Summary Report

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Class Summary Report

RegenerateCopyExport TXT?

Copy-ready text for planning or PLC notes.

This class view includes 360 student-subject records covering Fall 2025 to Spring 2026. Across the 354 records that carry both windows, the group began with an average percentile of 59.7 and ended with 62.5. Overall, 57% of records met growth and 55% of records exceeded projected growth. The 168 results (one per student and subject) that began below the secure benchmark closed 19% of the total distance to the 61st percentile. Compared with US norms by grade and season, the class averaged +6.8 RIT from benchmark, with 71% of records at or above norm, and moved +1.4 RIT relative to those norms across the two windows.

Growth was strongest in Reading, while Mathematics requires the most targeted support. 93 records moved up at least one percentile band, while 64 moved down.

Key intervention groups are Intensive Support: 27; Targeted Support: 41; Watch Group: 1; Secure but Regressing: 99. Key enrichment and extension groups are

Class Summary Report, shown with the sample data.

WHAT IT SHOWS

A copy-ready narrative of the current view, written from the same figures as the cards above it.

HOW TO READ IT

It follows your filters until you edit it; after that it keeps your words until you press Regenerate. Where a figure would rest on too few records it says so rather than quoting a percentage.

WHAT TO DO WITH IT

Paste it into PLC notes, a report to a leader, or the start of a data conversation, and edit it into your own voice.

5.18 Explorer

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Explorer, shown with the sample data.

WHAT IT SHOWS

Any two measures in the view plotted against each other, one point per record: choose what runs across and what runs up, colour the points by band, subject, class or the growth call, and read the trend line and the figures beside it. It has its own subject switch, so the rest of the page keeps your filters.

HOW TO READ IT

r runs from -1 to 1 and says how closely the points follow a straight line; R² is the share of the spread the line accounts for; n is how many records carry both measures, and a student tested in three subjects is three points. A relationship is a pattern in this group, not a cause: a start score that was lucky on the day is usually followed by a smaller gain whatever the teaching, and the notes under the figures say when a pair is linked by the way it is calculated. Under 10 records no trend line is drawn.

WHAT TO DO WITH IT

Look for the points far from the line - a student growing well beyond what their start predicts, or a class sitting apart from the rest - and click one to pin that student across their subjects. Export the points or the chart for a PLC slide.

ON A SINGLE-WINDOW FILE

Any two measures from this one test window plotted against each other, one point per record: choose what runs across and what runs up, colour the points by band, subject or class, and read the trend line and the figures beside it. Where the export carries NWEA's projection for the window ahead, that is one of the measures.

With one window nothing here measures growth: two scores from the same test day describe where students are, not how they are moving. r runs from -1 to 1 and says how closely the points follow a straight line, R^2 is the share of the spread the line accounts for, and n counts records, so a student tested in two subjects is two points. Under 10 records no trend line is drawn.

5.19 Table Groups and Seating Plan

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Table Groups and Seating Plan

90 of 90 students seated at 18 tables · balanced mixed tables by end %ile · up to 5 per table · averaged across visible subjects.

Print teacher copy Print wall plan Export CSV ?

Open the seating planner

90 students across 18 tables. Move students between seats, shape and place the tables, add the furniture, then print the plan.

Open

A seating plan is for one room, and 4 classes are in view. Pick one: **5A** **5B** **6A** **6B**

How this plan was made. Data: every subject in view, averaged into one profile per student. Students were ranked by end percentile, then dealt round the 18 tables in a snake (1 to 18, then 18 back to 1) so each table gets a spread of higher, middle and lower profiles. 90 of 90 students seated at 18 tables (up to 5 per table).

Teacher desk BOARD

This is the current plan. Open the planner to move anything.

TABLE SIZE PATTERN

5

One number for even tables, or a pattern for uneven tables.

Rebuild groups

GROUPING STRATEGY

Balanced mixed tables

SCORE USED

End percentile

1 One profile per student.

The records in view are averaged into one planning profile, or the filtered subject alone is used.

2 Ranked by the score you choose.

Now: **end percentile**. Students without a usable score wait in Unplaced rather than being seated by a number they do not have.

Table Groups and Seating Plan, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

Table groups built from the data by a chosen strategy, and a full-screen planner where every student has a seat at a shaped table you can move, turn and rename, in a room with your own furniture. The room is remembered on this device; the students never are.

HOW TO READ IT

Each seat carries the student's band colour and the score that drove the grouping; the strip on each table shows its band mix, so a balanced table reads as a spread of colours and a skill group as one block. The paragraph under the room says exactly how the plan was made, and the placement–order toggle numbers the seats in the order the strategy dealt them. Students without a usable score wait in Unplaced rather than being seated by a number they do not have.

WHAT TO DO WITH IT

Build the groups for the week, drag anyone the data placed badly to any seat (dropping on a taken seat swaps), then print the teacher copy for your planner and the wall plan, with names only, for the room.

5.20 Student Grouping Report

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Student Grouping Report

Export Grouping CSV

?

Groups are based on achievement band, growth projection, conditional growth, and gap status.

Student Grouping Report, shown with the sample data.

WHAT IT SHOWS

Every record in view in one sortable table: scores, bands, growth, gap status, the planning group the dashboard suggests and the teacher action that goes with it.

HOW TO READ IT

This is the full evidence behind every card above. Sort a column by clicking its heading; the group and gap filters at the top narrow it.

WHAT TO DO WITH IT

Export it as a CSV for your own planning documents, or open a student's name for their one–page spotlight.

ON A SINGLE-WINDOW FILE

Every record in view in one sortable table: RIT, percentile, band, tier, distance from the norm, the planning group the dashboard suggests and the teacher action that goes with it. Growth columns appear once a second window exists.

5.21 Priority Students (called Start-of-Year Support List on a single-window file)

ESSENTIALS On the page as it opens.

Priority Students

Export Priority CSV

?

Students with missed growth, band drops, missing end scores, negative growth, low end achievement, secure regression, or widened gaps.

182 records

STUDENT	SUBJECT	PRIORITY REASON	ACTION	SUGGESTED GROUP	GAP STATUS	END %ILE	RIT CHANGE
Aarav Sharma	Mathematics	Did not meet growth; Low growth and low achievement at end; Negative observed growth; Finished below the 21st percentile; Widened the gap	Use immediate reteaching, prerequisite checks, short-cycle monitoring, and small-group intervention.	Intensive Support	Gap Widened	2	-1
Abebe Tesfaye	Reading	Did not meet growth; Dropped percentile band; Negative observed growth; Started secure but regressed	Check for unfinished learning, engagement changes, or assessment conditions before assigning extension.	Secure but Regressing	Secure but Regressing	78	-1
Adaeze Nwosu	Language	Did not meet growth; Dropped percentile band; Negative observed growth; Started secure but regressed	Check for unfinished learning, engagement changes, or assessment conditions before assigning extension.	Secure but Regressing	Secure but Regressing	62	-7
Adaeze Nwosu	Mathematics	Did not meet growth; Widened the gap	Plan focused small-group lessons around the highest-impact skills and check progress frequently.	Targeted Support	Gap Widened	43	+9
Aditi Rao	Reading	Finished below the 21st percentile	Protect the successful supports already working and keep pushing toward the secure benchmark.	Catch-Up Growth	Gap Reduced	6	+11

Priority Students, shown with the sample data.

WHAT IT SHOWS

Records that need attention first, each with the reasons: missed growth, a dropped band, a missing end score, negative growth, finishing below the 21st percentile, secure regression or a widened gap.

HOW TO READ IT

A record can be listed for a reason other than low achievement, so the reason column matters more than the tier. A met-growth call within measurement error is marked too close to call.

WHAT TO DO WITH IT

This is where the first small groups come from. Name three students and what changes for them this week, before anyone asks.

ON A SINGLE-WINDOW FILE

Records that need attention from the start of the year, each with the reasons: starting below the 41st percentile, testing a grade or more below placement, sitting well below the norm, needing above-typical growth to reach grade level, or a score that needs confirming.

A record can be listed for a reason other than low achievement, so the reason column matters more than the tier.

Start-of-Year Support List

Export Priority CSV?

Students starting furthest from the secure benchmark or from the US grade/season norm, plus anyone whose score needs confirming.

119 records

STUDENT ↑	STUDENT ID ↑	SUBJECT ↑	GRADE ↑	CLASS ↑	RIT ↑	PERCENTILE ↑	TIER ↑	VS US NORM ↑	US NORM GRADE LEVEL ↑	GAIN TO GRADE LEV
Aarav Sharma	D250058	Reading	6	6A	186	9	Intensive	-23	Norm level 3 vs grade 6 (-3 grades) Delta RIT -23 Fall norm 209	+26
Aarav Sharma	D250058	Language	6	6A	197	29	Strategic	-9	Norm level 4 vs grade 6 (-2 grades) Delta RIT -9 Fall norm 206	+13
Aarav Sharma	D250058	Mathematics	6	6A	183	5	Intensive	-27	Norm level 3 vs grade 6 (-3 grades) Delta RIT -27 Fall norm 210	+37
Aarav Sharma	D250058	Science	6	6A	194	22	Strategic	-10	Norm level 4	+13

On a fall file the list becomes the Start-of-Year Support List, with start-of-year reasons.

5.22 Wall Posters

ESSENTIALS On the page as it opens.

Wall Posters

Data stories for the classroom wall, sized for A3, in sections: the whole class first, then one section per subject. The subject sections are selected to start; tick the whole-class section to add the combined set. Class-level only — no student is named and no individual score appears.

Print selected (A3 landscape) **Select all** ?

Written for students, not for you
Each poster says one thing a student can act on, in language they can read. The method notes stay in the dashboard.

Nobody is named
Every figure is a class total, share or median. A poster on a wall is seen by visitors, so no name, no individual score and no rank appears on one.

They follow your filters
Filter to one class or one subject and the posters describe that group. The footer of each poster records which group it came from.

Printing
One poster per page, in A3 or A4, landscape or portrait. In the print dialog set the paper size to match, margins to none, scale to 100%, and turn on background graphics.

PAGE: **A3 landscape** **HEADING ON EVERY POSTER** **20 of 31 selected | A3 landscape**
Optional. Use the class name the students know.

Whole class, every subject together
90 students | 11 posters ☐ **Select all in this section**

☐ **We grew this year**
The share of the class who met or beat the growth NWEA projected for them.

Print this one

☐ **Where we are now**
The class spread across the five NWEA colour bands, as counts rather than names.

Print this one

☐ **Our learning areas**
The strand the class is strongest in and the one to work on next, from the Class Profile export.

Print this one

☐ **The RIT ladder**
What a year of growth looks like on the RIT scale, from where the class is now.

Print this one

☐ **Growth is measured fairly**
Median conditional growth by starting band, showing that growth is judged against a fair comparison.

Print this one

☐ **Take your time**
Median test length and the number of tests that were rushed, as a case for slowing down.

Print this one

Wall Posters, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

Posters for the classroom wall, written for students in student language: class shares, medians and counts only, with no name, no individual score and no rank on any of them.

HOW TO READ IT

Which posters are available depends on the file: growth posters need two windows and at least 10 growth results, the learning-areas poster needs a Class Profile export, and every poster needs at least 5 students in view. The footer of each records which group it describes.

WHAT TO DO WITH IT

Tick the posters you want, choose A3 or A4, add the class name the students know, and print with background graphics on and fit-to-page.

5.23 Check My Understanding

ESSENTIALS On the page as it opens.

Check My Understanding

Start over ?

The questions a principal, inspector or governor is likely to ask about this data, with every answer worked out from the records currently in view. A practice run before the real conversation.

Question 1 of 12 0 of 1 answered correctly

GOVERNOR ASKS Snapshot

How many students are in this view? A student tested in two subjects is two records, and I want students, not records.

A 87 X

B 360

C 89

D 90 ✓

Not quite. The answer is 90.

90 students across 360 student-subject records. Class Snapshot shows one number with the other as its hint: a student appears once per subject, so records always run ahead of students, and every figure on this page that says records is not a count of students.

Likely follow-up: Give me both numbers for your support list, records and students, and tell me which student is on it in two subjects.

Next question Show me: Class Snapshot

Check My Understanding, shown with the sample data.

WHAT IT SHOWS

A practice run for the data conversation: multiple-choice and true-or-false questions a principal, inspector, governor, data lead or head of department would ask about the records in view, marked against the figures on this page.

HOW TO READ IT

Every question is built from the current view, so filter to one class or subject to rehearse for that meeting. Each answer is coached with the figure, a jump to the section that shows it, and the follow-up a leader would ask next.

WHAT TO DO WITH IT

Run a set before a data meeting, read back the ones you missed, and copy the prep notes.

Your file never leaves your computer.

Page 38 of 48

5.24 Celebration Students (called Strengths to Build On on a single-window file)

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

Celebration Students

Export Celebration CSV

Students showing exceeded growth, band movement, gap closure, strong RIT improvement, or quadrant improvement.

196 records

STUDENT	SUBJECT	CELEBRATION REASON	NEXT EXTENSION	GROWTH EFFICIENCY	%ILE CHANGE	BAND MOVEMENT	GAP STATUS
Aarav Sharma	Reading	Exceeded projected growth; Moved up a band; Improved RIT strongly	Celebrate the growth and keep the intervention plan consistent.	267% Exceeded strongly	+19	Moved Up	Gap Reduced
Aarav Sharma	Language	Exceeded projected growth; Moved up a band; Reduced gap significantly; Improved RIT strongly	Celebrate the growth and keep the intervention plan consistent.	300% Exceeded strongly	+26	Moved Up	Gap Reduced
Aarav Sharma	Science	Exceeded projected growth (too close to call)	Celebrate the growth and keep the intervention plan consistent.	175% Met (too close to call)	+11	Stayed Same	Gap Reduced
Abebe Tesfaye	Language	Exceeded projected growth (too close to call)	Assign extension work and track whether high achievement is still paired with high growth.	700% Met (too close to call)	+2	Stayed Same	Secure and
Abebe Tesfaye	Mathematics	Exceeded projected growth (too close to call); Reduced gap significantly	Celebrate the growth and keep the intervention plan consistent.	110% Met (too close to call)	+2	Stayed Same	Gap Reduced
Abebe Tesfaye	Science	Exceeded projected growth; Moved up a band; Closed the gap; Improved RIT strongly	Assign extension work and track whether high achievement is still paired with	700% Exceeded strongly	+46	Moved Up	Gap Closed

Celebration Students, shown with the sample data.

WHAT IT SHOWS

Records with something to celebrate: growth beyond the projection, a band moved up, a gap closed or sharply reduced, a strong RIT gain, or a rise from low to high on a quadrant axis, each with a next extension.

HOW TO READ IT

Celebration is about growth, not just high scores. A secure student who grew slowly is not here; a low starter who beat their projection is.

WHAT TO DO WITH IT

Name the success to the student, then set the next measurable target so celebration does not turn into coasting.

ON A SINGLE-WINDOW FILE

Records already showing a strength at the start of the year: at or above the secure line, well above the norm mean, testing a grade or more above placement, or already above the grade-level target, each with an extension action.

These are strengths to build on from day one, not growth: with one window nothing here measures movement.

5.25 Data Check

FULL ANALYSIS Choose *More analysis* in the Jump to bar to show it.

? Data Check What was read from the file, what was skipped, and anything worth confirming before you plan from it.							
ROWS READ 718 77 columns, comma separated	RECORDS WITH A SCORE 360	NO SCORE IN WINDOW 0	SUPPRESSED CELLS 0 Values such as *** that NWEA hides	SHORT TESTS 2	INVALID TESTS REMOVED n/a No test status column in this export		
RAPID GUESSING 4 Tests at or above 10% rapid guessing	RECORDS SET ASIDE 0 One record per student, subject and window is kept	NO GRADE RECORDED 0 Norm comparison needs a grade	ISSUES TO REVIEW 6				
Files combined sample-asg.csv, sample-class-profile.csv. They were read as one data set. A Class Profile export is one file per test, so loading them together is how you get every subject in one view.							
Records combined across files 2 record(s) carry NWEA's projected growth and projected RIT for a window that has not been tested yet. This export carries NWEA's own projection for the window ahead: the growth it expects this student to make, and the RIT that follows from it. It is conditioned on the student's own starting score and grade rather than on a class-level norm mean, and it is the figure the next export will score "met growth" against - so it leads here. The norm-referenced targets stay beside it, because a projection describes typical progress from where a student is, not the distance to grade level.							
NWEA projection for the window ahead 2 record(s) carry NWEA's projected growth and projected RIT for a window that has not been tested yet. This export carries NWEA's own projection for the window ahead: the growth it expects this student to make, and the RIT that follows from it. It is conditioned on the student's own starting score and grade rather than on a class-level norm mean, and it is the figure the next export will score "met growth" against - so it leads here. The norm-referenced targets stay beside it, because a projection describes typical progress from where a student is, not the distance to grade level.							
Instructional areas found 358 record(s) carry instructional area scores, so the Areas section is available. An instructional area RIT rests on a fraction of the items behind the overall RIT, and NWEA publishes no percentile or norm for one. Every area figure here is the difference from the same student's own overall RIT on the same test.							
Met-growth calls too close to call 253 of 354 met-growth results sit within measurement error of the projection, so this test pair cannot resolve them either way. A RIT score carries a standard error, so the difference between two of them carries a larger one. Where the export reports it, growth is shown with a 95% range and a result inside that range of its projection is marked too close to call. NWEA's own Yes or No is never changed - this sits beside it. The error is within-test only: it does not include illness, motivation or a bad morning, so the true uncertainty is wider than the range shown, not narrower.							
Rapid guessing 358 record(s) report NWEA's rapid-guessing measure, median 0%. NWEA reports the share of items a student answered faster than they could have read them. This dashboard flags a test at 10% or more. Rapid guessing depresses the score, so a flagged test understates what the student can do - it is not a reason to lower expectations.							
Median test duration 45 minutes. Flagged tests finished in under 20 minutes and in less than half the median time for this file. Short tests are worth confirming with the proctor before the score is used for placement; they are not automatically invalid.							
Norms reference This export was scored against NWEA's 2025 norms, which matches the reference table built into this page.							
Windows compared Fall 2025 to Spring 2026. Taken from the export's own growth comparison period, which is more reliable than the term columns - in a spring export those name the reporting term for both windows.							
Weeks of instruction between windows 29 weeks, as reported by NWEA. Growth projections assume a typical interval, so a noticeably shorter or longer gap is worth holding in mind when reading whether growth was met.							
How norms are used US norm figures come from the 2025 NWEA norms study: grade-level mean RIT and standard deviation for each season, as published, rounded to whole points. They are used here as a reference, not as a substitute for the official study, and a school with its own norm tables should read the comparisons as indicative. Every norm-referenced figure on this page comes from this table, never from anything in your file.							
Median conditional growth percentile Median conditional growth percentile is recalculated from the records currently visible, so it moves with your filters. Your export also carries NWEA's own class-level median, which is fixed for the whole class.							

Data Check, shown with the sample data.

WHAT IT SHOWS

What was read from the file and what was not: rows, columns, suppressed cells, tests with no score, duplicate rows, tests marked not valid, short or rapidly guessed tests, the norms study the file was scored against, and the rule that turns thin percentages into counts.

HOW TO READ IT

Check it before you plan from anything else. A missing column hides a feature rather than showing a zero; a norms mismatch means the RIT-versus-norm figures will not match your MAP reports; a short test is a signal to confirm, not an invalid score.

WHAT TO DO WITH IT

Chase the students with no score, confirm the short tests, and read the counts-instead-of-percentages note if a figure surprised you.

6. Printing, exporting and the classroom wall

Exports

- **Summary TXT** from Class Snapshot or the Class Summary Report – the narrative as plain text for notes or an email.
- **CSV exports** from Grouping, Priority, Celebration, Gap Closure, Growth Goals, Instructional Areas, What Would It Take and Table Groups, and from the analytical sections: the Insights findings, the Distributions statistics, the Movement records, the Heatmap cells and the Explorer points. Exports always include every row, even when the table on screen shows a page of them. The table groups export has one row per seat: table, seat, shape, the order the strategy placed each student and whether you moved them by hand, then the student's scores.
- **The Explorer chart as a picture** – *Download SVG* saves the scatter as you have set it up, trend line and all, for a slide or a department document.
- **Copy** buttons on the Insights findings, the Summary, the Action Board, a student's spotlight and the quiz results put the text on your clipboard.
- **Show the numbers** under the charts in the analytical sections opens the table behind the chart, for reading instead of looking.

Printing

- **Goal sheets** – two pages per student from Growth Goals. Page one is the data: where they are now in each subject, their next step, and the instructional areas inside each subject. Page two is theirs to fill in: the same targets in one line each, the part of each subject to work on first, and ruled space for the goal they set, what they will do about it and how you will help, with a line for both signatures and the date.
- **The action plan** – the Action Board as a printable list of moves with the students named.
- **The seating plan** – two prints from the planner. The *teacher copy* draws the room as you arranged it, every seat with the student's band colour and score, then adds a roster page per table with band, percentile, growth and planning group, and the paragraph that says how the plan was built. The *wall plan* draws the same room with names only: no score, no colour, nothing a visitor can read as data. Both fit A4 or A3, landscape or portrait to match the room's shape; choose A3 for a wall plan or a room with more than six tables.
- **A student one-pager** – open any student's name for their spotlight, then print it for a conference.
- **The page itself** – the browser's print command prints the dashboard; the quiz and the seating tools are left out.

Wall posters

Posters are written for students, in student language, and carry class shares, medians and counts only: no name, no individual score, no rank. They follow your filters, so filter to one class before you print, and the footer of each records which group it describes. Which posters are available depends on the file: growth posters need two windows and at least 10 growth results, the learning-areas poster needs a Class Profile export, and every poster needs at least 5 students in view.

POSTER	WHAT IT SAYS
We grew this year	The share of the class who met or beat the growth NWEA projected for them.
Where we are now	The class spread across the five NWEA colour bands, as counts rather than names.
Our learning areas	The strand the class is strongest in and the one to work on next, from the Class Profile export.
The RIT ladder	What a year of growth looks like on the RIT scale, from where the class is now.
Growth is measured fairly	Median conditional growth by starting band, showing that growth is judged against a fair comparison.
Take your time	Median test length and the number of tests that were rushed, as a case for slowing down.
Our next milestone	How many more results the class needs above the chosen line to reach its target.
Catching up	Of the results that started below the class benchmark, how many moved towards it or crossed it.
Moving up	How many results moved up a whole colour band, stayed, or moved down, as counts rather than names.
Our subjects side by side	The class's middle percentile in each subject, so the strongest subject and the next focus are both on the wall.
How to read a MAP score	RIT, percentile and growth score explained in student language, with the five colour bands.

Choose A3 or A4, landscape or portrait; add the class name the students know; tick the posters you want and print. In the print dialog turn on background graphics and choose fit to page.

7. Before a data meeting

Four sections are built for the conversation with a leader rather than for planning.

- **Insights** puts the headline figures against national references and ranks what stands out by the strength of the evidence, each finding saying how many students it rests on and how sure it is. Take the top two into the meeting and copy the rest into your notes.
- **Class Summary Report** writes the narrative for you, from the same figures as the cards. Edit it into your own voice and paste it into your notes.
- **Check My Understanding** asks you the questions a principal, inspector, governor, data lead or head of department would ask about the records in view, marks your answers against the page, and shows where each figure lives. Filter to the class the meeting is about, run a set, read back what you missed, and copy the prep notes.
- **Data Check** is the section to read first, so that nothing in the meeting surprises you: which students have no score, which tests were short, whether the file was scored against the norms study the page expects.

A USEFUL ORDER

Data Check, then Insights and the Class Snapshot, then the Priority list and the Action Board, then the Summary. That is the order a leader will ask about them.

8. When something looks wrong

The file was skipped or nothing loaded

The file needs a RIT or percentile column. Check that it is a MAP export rather than a roster or a summary sheet, and that it is the CSV rather than the PDF or Excel version. Data Check lists any file that was skipped and why.

A section is missing

The page opens on the essentials: choose *More analysis* in the *Jump to* bar to show the rest. Beyond that, sections a file cannot support are hidden rather than shown empty: growth sections (Growth, Movement, Gap Closure) need two windows, the Instructional Areas section and the Heatmap's student grid need a Class Profile export, and any column the export lacks hides the feature that depends on it.

A figure shows "3 of 4" instead of a percentage, or "Too few"

Fewer than 10 records sit behind it. Widen the filters or read the count as a count.

"No US norm available"

NWEA publishes norms for Reading and Mathematics from kindergarten and for Language and Science from grade 2, and a record needs a grade to match. The Data Check counts the records that could not be matched and recovers grades suppressed on one row from the same student's other rows.

The RIT-versus-norm figures do not match my MAP report

The file was scored against a different norms study from the table built into the page; Data Check names both. Everything driven by the percentiles in your file is unaffected.

Printing opened nothing

A popup blocker stopped the print window. The dashboard downloads the same document as an HTML file instead; open it and print from there.

The posters are not available

Posters need at least 5 students in view, and any poster built on a percentage needs at least 10 records behind it. Clear the search and filters.

A. Glossary and reference tables

Planning groups and the teacher action that goes with them

GROUP	SUGGESTED ACTION
Intensive Support	Use immediate reteaching, prerequisite checks, short-cycle monitoring, and small-group intervention.
Targeted Support	Plan focused small-group lessons around the highest-impact skills and check progress frequently.
Watch Group	Keep core instruction tight, add quick checks, and respond before flat growth becomes a larger gap.
Secure / Maintain	Maintain grade-level access, spiral key skills, and monitor for steady progress.
Enrichment	Provide extension tasks, advanced problem solving, independent reading or inquiry, and leadership opportunities.
Catch-Up Growth	Protect the successful supports already working and keep pushing toward the secure benchmark.
Secure but Regressing	Check for unfinished learning, engagement changes, or assessment conditions before assigning extension.
Incomplete Data	Confirm testing status and avoid making placement decisions from incomplete growth data.
Core Instruction	Keep grade-level core instruction as the plan, with quick checks for understanding on the highest-leverage skills.
No Score Yet	Confirm whether this student tested. Do not place them from an absent or suppressed score.
Coasting Watch	Achievement is high but growth is not. Raise the challenge level and set a growth target rather than an achievement target.

Method notes, as they appear on the page

Norm Equivalent

Grade-level equivalence compares a student's RIT with the mean RIT for each grade in the same season. It is a rough placement signal, not a reading or maths "grade level", and it is least reliable at the top and bottom of the scale.

Keep Pace

Keep-pace targets add the gain a typical student at this grade makes between these two seasons (the difference between the two US norm means). They describe typical peer progress, not an NWEA projected RIT.

Grade Level

Grade-level targets are the US norm mean RIT for this grade and season, which sits near the 50th percentile. Reaching it from below requires more than typical growth.

Growth Error

A RIT score carries a standard error, so the difference between two of them carries a larger one. Where the export reports it, growth is shown with a 95% range and a result inside that range of its projection is marked too close to call. NWEA's own Yes or No is never changed – this sits beside it. The error is within-test only: it does not include illness, motivation or a bad morning, so the true uncertainty is wider than the range shown, not narrower.

Test Validity

NWEA marks a test it does not consider usable in the Status column. Those records are excluded from every aggregate, chart, poster and planning group on this page, and listed by name with their reason in Data Check. A status this page does not recognise is kept and counted, never silently dropped.

Rapid Guess

NWEA reports the share of items a student answered faster than they could have read them. This dashboard flags a test at 10% or more. Rapid guessing depresses the score, so a flagged test understates what the student can do – it is not a reason to lower expectations.

Instructional Area

An instructional area RIT rests on a fraction of the items behind the overall RIT, and NWEA publishes no percentile or norm for one. Every area figure here is the difference from the same student's own overall RIT on the same test.

Short Test

Flagged tests finished in under 20 minutes and in less than half the median time for this file. Short tests are worth confirming with the proctor before the score is used for placement; they are not automatically invalid.

Baseline

This file has one test window, so no growth can be measured. Everything below describes where students are starting, not how far they have moved.

Secure Benchmark

The 61st percentile is a locally chosen “secure” line, not an NWEA definition. Gap closure counts percentile-rank points, which are positions in a distribution rather than equal-sized units, so a ten-point move near the middle of the scale is a larger change in RIT than a ten-point move near either end. Read it as direction and rough magnitude, not as a precise quantity.

Norm Source

US norm figures come from the 2025 NWEA norms study: grade-level mean RIT and standard deviation for each season, as published, rounded to whole points. They are used here as a reference, not as a substitute for the official study, and a school with its own norm tables should read the comparisons as indicative. Every norm-referenced figure on this page comes from this table, never from anything in your file.

Typical Gain Source

Within a school year the typical gain is NWEA's published student growth norm for this grade and subject, not one achievement mean subtracted from another. The two are different statistics – achievement norms are cross-sectional, growth norms are measured on students who sat both tests – and rounded separately, so they disagree by a point in about a quarter of cells. Across a grade boundary (spring to the next spring) NWEA publishes no growth norm, so that one figure is the difference of the two achievement means and is labelled as derived.

Median C G P

Median conditional growth percentile is recalculated from the records currently visible, so it moves with your filters. Your export also carries NWEA's own class-level median, which is fixed for the whole class.

Nwea Projection

In a two-window export, NWEA's projected RIT describes the window already measured, so it is a record of what was expected rather than a target ahead. The norm-referenced targets below are used instead.

Forward Projection

This export carries NWEA's own projection for the window ahead: the growth it expects this student to make, and the RIT that follows from it. It is conditioned on the student's own starting score and grade rather than on a class-level norm mean, and it is the figure the next export will score "met growth" against – so it leads here. The norm-referenced targets stay beside it, because a projection describes typical progress from where a student is, not the distance to grade level.
